3 Conclusion	5
4 Appendix	5

HK-NOTES

- If an entry involves several actors, only the most relevant ones are shown by default; click **" +N more related actors "** on an entry to reveal the rest, both in the list and on the map.
- An **"Entries addressed to (sub-)groups this actor belongs to"** section (collapsed by default) shows entries aimed at the actor's category or sub-category rather than at them personally — e.g. something addressed to "Industry" generally, which every industry actor inherits. Click to expand it.
 - If the selected actor has specific **relevant Work Packages** assigned to it, entries from other categories are pre-filtered to just those WPs. A small note tells you when this filter is active, with a one-click option to see everything instead.

Summary

1 Introduction

This deliverable is the first iteration of the give-and-take matrix connecting research within ACHIEVE Work Packages and relevant stakeholders. Instead of using a classic give-and-take matrix format, this tool takes the form of an interactive, publicly available HTML visualisation that both researchers and relevant stakeholders can use to explore what is expected of them and what they can contribute to one another within the context of ACHIEVE.

The tool will be launched and introduced publicly in an instructional webinar on 29 October 2026, during which relevant stakeholders will be invited to explore the tool themselves and add new inputs or refine existing ones. The first iteration of this tool is intended to establish a common understanding of respective roles and to highlight possible synergies or discrepancies in expectations and capacities of different stakeholders early in the programme, to avoid missed opportunities or conflicts in future years.

The tool will be revisited over the course of ACHIEVE (Month 24, Month 60) as the consortium grows and research progresses, so that it continues to adapt alongside research progress and stakeholders' evolving expectations.

2 Deliverable content

The give-and-take tool maps expected linkages (i.e. expectations and contributions) between ACHIEVE's research Work Packages (WPs) and external stakeholders from industry, policy, and society. Each linkage is captured as either a give (something an actor provides) or a take (something an actor wishes to receive). Each "give" and "take" is assigned to the actor who claimed it. The "gives" and "takes" claimed by Research stakeholders are based on the Deliverables in the ACHIEVE Proposal and the Problem Framing interviews conducted with researchers from WPs 1-5 (see Appendix Table 1). Meanwhile, the "gives" and "takes" claimed by non-Research stakeholders (Industry, Policy, Society) are informed by Problem Framing interviews with these selected stakeholders (see Appendix Table 2).

How to use the tool

The steps below explain how users can read the map, open an actor's entries, and filter or search. The last step (adding new entries) applies only to the internal KTT team.

1. Reading the map

Actors are organised into **sub-categories** within four **stakeholder groups** (Industry, Policy, Society, and Research), shown as clustered bubbles on the map.

- The Research stakeholder group works differently from the other three: instead of actors clustered into sub-categories and individual organisations, each research Work Package (1-5) is considered an “actor”. All entries in the matrix link to at least one WP.
- **Entries** (gives and takes) are represented by arrows between actors. Solid lines are “gives” and dashed lines are “takes”. The direction of the arrow indicates the direction of the link (e.g., a solid arrow pointing from SFOE to WP 3 means “SFOE provides [give] to WP 3”).

For the first iteration of the matrix, only the gives and takes between non-research and research stakeholders are mapped (i.e. Industry <-> Research; Policy <-> Research; Society <-> Research).

In future iterations, as stakeholder collaboration through the ACHIEVE consortium is strengthened, new linkages may be added between non-academic stakeholders (e.g. Industry <-> Society; Industry <-> Policy; Policy <-> Society).

2. Selecting an actor and understanding entries

Select any category, sub-category, or actor bubble to open its Give-and-Take matrix in the right-hand panel. The rows that appear list all stakeholder categories this actor has linkages with. As these are opened and expanded, all “gives” and “takes” relevant to this stakeholder group are listed to scroll through.

The matrix is split into two columns:

1. **Give = [selected actor] provides;**
2. **Take [selected actor] receives**

Because both actors report their own gives and takes independently, each relationship is shown from two angles: Actor 1’s perspective; Actor 2’s perspective. Presenting these views together allows the user to easily compare them and assess where stakeholder expectations and capacities are aligned or mismatched.

For example, in the matrix below Actor 1 is **IP-Suisse** and Actor 2 is **WP 1 (Agri-food)**.

GIVE (IP-Suisse provides)	TAKE (IP-Suisse receives)
IP-Suisse's perspective	
IP Suisse → WP 1 What can IP-Suisse provide WP 1, according to IP-Suisse?	WP 1 → IP Suisse What does IP-Suisse expect from WP 1, according to IP-Suisse?
WP 1 (Agri-food)'s perspective	
IP-Suisse → WP 1	WP 1 → IP-Suisse What can WP 1 provide IP-Suisse, according to WP 1 researchers?

What does WP 1 expect from IP-Suisse, according to WP 1 researchers?	
--	--

The search box at the top of the matrix can be used to search entries for specific stakeholder categories, sub-categories, or actors.

Entries linked to a sub-category mean the “give” or “take” is relevant to any or all actors in this sub-group.

Decision support: Roadmaps and reports

Actionable emission reduction measures to implement, and an understanding of the conditions that make them effective

WP 1: Agri-food — Industry associations +2

Source: WP 1 Internal (Researcher) Interview

For example, this entry shows **WP 1** providing actionable emission reduction measures to **all relevant Industry associations**.

Entries linked to a specific actor mean the “give” or “take” is relevant to this specific actor.

Modelling tools and methods

Existing GHG calculators and emissions-documentation tools

+1 IP-Suisse — WP 1: Agri-food

Source: WP 1 Internal (Research) Interview

For example, this entry shows **WP 1** receiving existing GHG calculators and emissions-documentation tools from **IP-Suisse** specifically.

3. Filtering and searching options

Entries can be filtered by using the “FILTER BY” banners at the top of the side-panel. Entries can be filtered by: category, sub-category, entry source (Proposal, Interview, or Other) and type of entry (e.g. field knowledge and best practices).

The “Show all connections” banner (top-right of the panel) switches to a full list of every entry, grouped by who owns it, with its own search box. This is useful for scanning all entries at once rather than actor-by-actor.

4. Adding entries and stakeholders (non-public version)

Internal, non-public version only: Entries (gives and takes) can be added for any actor in the matrix by selecting the “+ Add” buttons in the Give and Take columns. Selecting this button opens a form to complete where the entry content can be typed in a text box and the relevant stakeholders can be selected (or searched) from a checklist.

New stakeholders and sub-categories can also be added to the matrix by clicking the black “+ Add Actor” button at the top of the webpage.

These features allow KTT to keep the matrix continuously updated on a regular, controlled basis as the consortium and its stakeholder relationships evolve.

3 Conclusion

The Give-and-Take Matrix tool intends to make expectations and contributions between researchers (WPs 1–5) and external stakeholders from industry, policy, and society explicit, structured, and accessible. It converts knowledge that is usually implicit and scattered across individual conversations (who expects what from whom, and who can offer what to whom) into a single, shared, searchable reference that the consortium and its stakeholders can consult, contribute to, and hold each other accountable to.

Accountability from the outset: by documenting early roles, expectations, and contributions for every Work Package and relevant stakeholder groups, the tool solidifies who is responsible for what before misunderstandings can appear.

Early detection of synergies and gaps: because gives and takes are captured from both sides of each relationship, the tool reveals where expectations already match, where potential capacities are underused, and where expectations or needs risk being unmet.

A living resource: The tool's first public introduction, at the instructional webinar on 29 October 2026, marks the start of an iterative process: stakeholders will be invited not only to explore the matrix but to actively shape it. Then, as the tool is designed to be revisited at Month 24 and Month 60, alongside the growth of the consortium and the progress of research, it will also function as a running record of how roles, needs, and collaborations evolve over ACHIEVE's lifetime. In this sense, the Give-and-Take Matrix is not a static report but a co-created, living instrument for stakeholder-research collaboration throughout ACHIEVE.

4 Appendix

Problem Framing interview questions informing Give-and-Take

- 1. Gives:** What knowledge, data, networks, or other resources could you or your organization contribute to ACHIEVE's research in [*insert WP header*]?
- 2. Takes:** What expectations do you have of ACHIEVE's output? What key output is most relevant or interesting to your work?
